

System delay:

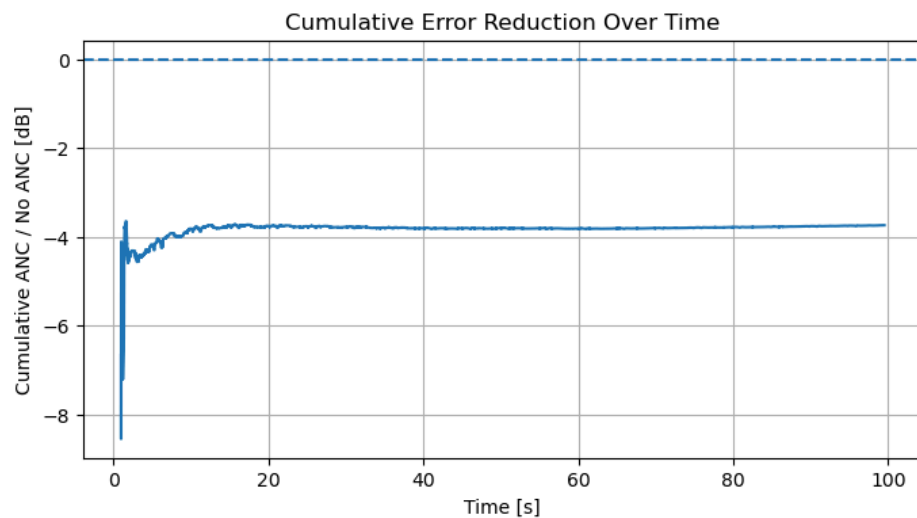

- Focusrite has a fixed set of available buffer sizes ranging from 16 to 1024 samples
 - Each has an inherent delay, 16 samples is 4.9ms
- Sounddevice library also has a latency setting
 - Default is ~90ms
 - Can be manually set to 0ms, so the only delay is from the focusrite
- In practice, it seems like a buffer size of 64 is the minimum stable size
 - ~8ms of delay, about 376 samples at 48kHz
- Safe mode adds an extra 1ms (~50 sample) delay
 - Seems safe to turn it off for 64 buffer size? 7.9ms to 6.9ms
 - 48 buffer size is 6.2ms and is not stable

Seeding with deltas again:

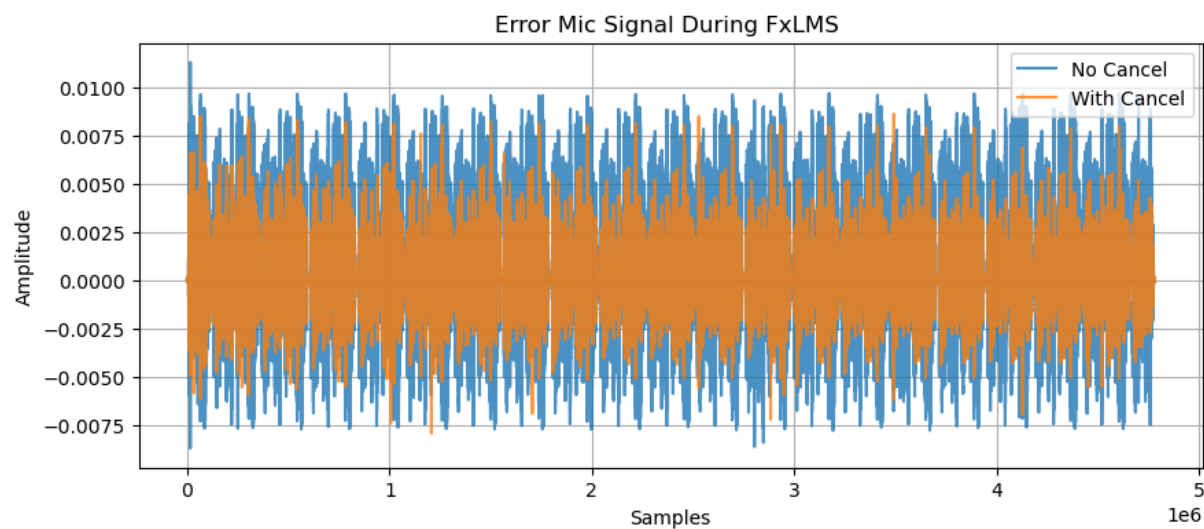

- Ran another grid search seeding deltas at various locations
 - A delta at sample 64 worked best, ~-3.9 dB
- Learning was most stable at lag of 376

Lag: 518, db reduction: -3.74

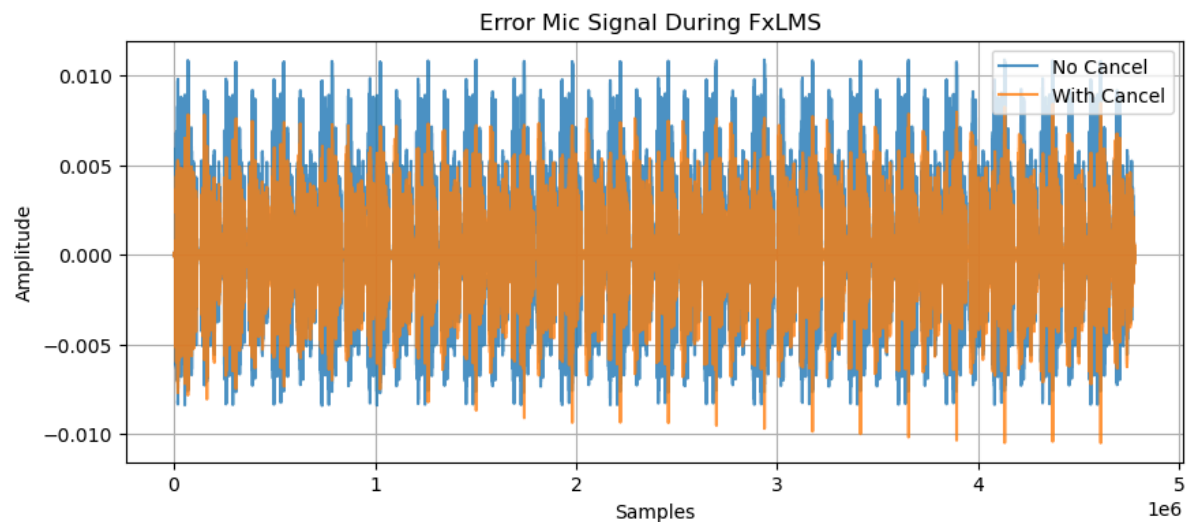

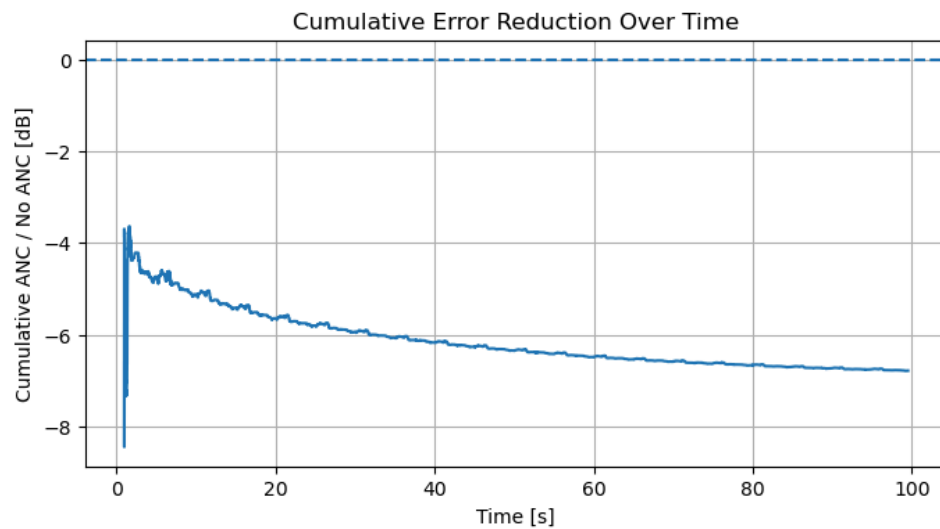

Lag: 376, db reduction: -6.75

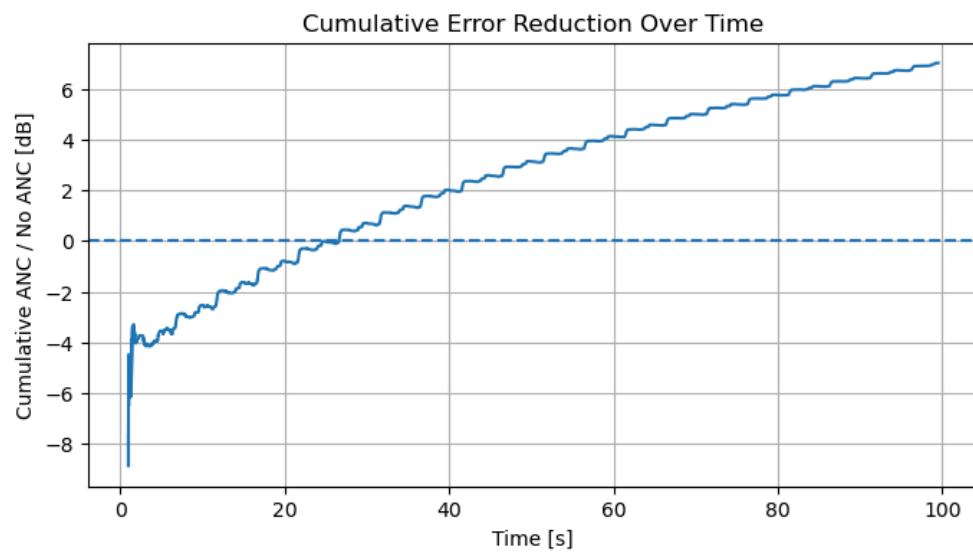

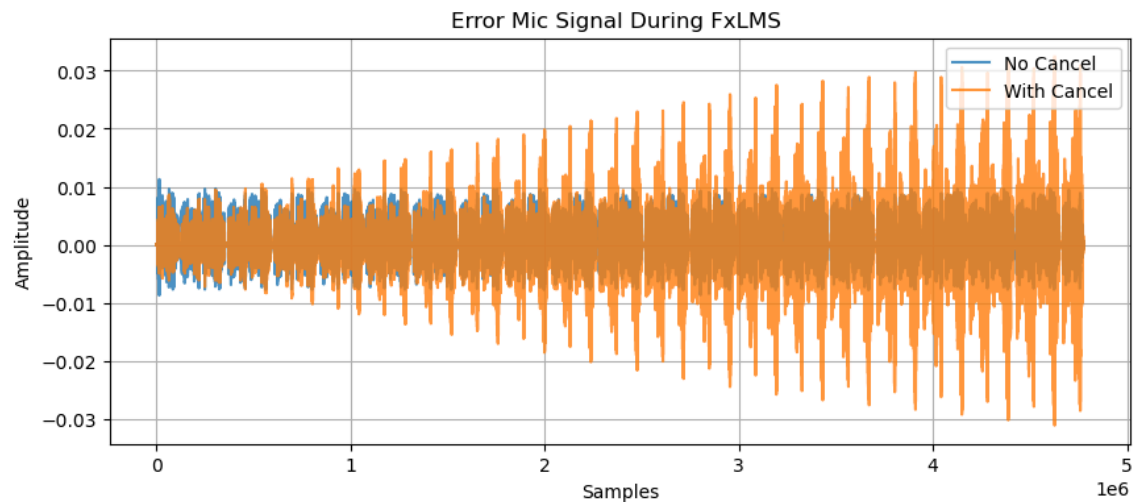

(previous best for reference)

Lag: 0, db reduction: 6.96

- There seems to be a limit on the repetitions before overfitting

dB reduction: -5.56
